

TESTIMONIAL

“Over a two-month period, we worked closely with Portotalent to further streamline and strengthen our workflows in EPLAN. During the first phase, they took the time to thoroughly understand how our engineering department operates — from pre-planning all the way to the development of complete electrical schematics. Their ability to quickly grasp our processes gave us immediate confidence in their technical expertise and collaborative approach.

In the second month, they dived deeper into our distribution boards for data centers. They reviewed the architecture, logic, and components, and translated this into a full electrical schematic. In addition, they developed a complementary automation and control schematic that fit seamlessly with our requirements. It became clear that Portotalent not only understands our way of working, but is also capable of delivering high-quality technical documentation.

One of the key objectives of this collaboration was to establish a solid communication channel and build mutual trust. They achieved exactly that — we now know we can rely on their support at any moment, whether it’s for specific projects, peak workloads, or specialized engineering knowledge.

Following this successful initial phase, we expanded our partnership. Portotalent supported us in entering a new market segment by converting the entire HVAC system of our new office and production facility to EPLAN. They created a complete P&ID and developed all related electrical documentation. This gave us a strong structural foundation that enables us to begin operating confidently in the HVAC sector.

Portotalent has proven to be a reliable and highly skilled partner. Their technical expertise, flexibility, and proactive mindset make them a valuable extension of our engineering team.”
